PRODUCT CASE STUDY · B2B SALES

Ten Today

Ten actions a day. Every approval on a clock.

tentoday.vercel.app

WHY · THE PROBLEM

Deals stall between the rep and the approver

Too many

Endless lists

Reps carry far more open tasks than they can do in a day, so the follow-up that matters gets buried.

No clock

Nobody owns the wait

When a deal needs a discount, it waits on an approver. The rep keeps chasing; nobody is on the clock.

45%

Approval delay loses deals

An industry survey by Conga reports that 45% of companies lost a deal to slow quote approval.

The 45% figure is vendor-reported (Conga). To be validated with sales heads before any build.

A capped, ranked day, with approvals on the approver’s clock

A sales to-do module that layers on the CRM: ten ranked actions a day, an approval freeze, and a manager view of exceptions.

Today, capped at 10

Four ranking rules decide the order; every task shows why it ranks there. Pinned callbacks count toward the cap.

Approval freeze

A pending approval freezes the rep’s task for that customer and moves the clock to the approver.

Exceptions, not activity

The manager sees overload, overdue and on-hold, with a confirm-first rebalance.

HOW · IT WORKS

The rules, running

1

Rank

Four rules order open tasks; Today shows the top 10, pinned callbacks included.

2

Act

Done, reschedule or on hold. On hold needs a reason; a second reschedule needs a blocker and keeps ageing from the original target.

3

Stage moved

A stage change auto-closes the task and creates the next one.

4

Approve

The approver sees three numbers: ask, margin floor, customer overdue (e.g. 6% · 4% · ₹0).

5

Close the day

End-of-day summary; the manager can rebalance overdue work. Approvals never move to a rep.

At the start, middle and end of a rep’s day

When it runs

Start of day: the ranked ten. Mid-deal: the moment a discount needs approval. End of day: “Close the day” summary.

Who it is for

Sales reps work the list; approvers (sales manager or finance) decide discounts; the sales head sees exceptions and rebalances.

Deliberately out of scope

Replacing the CRM, a weighted priority score, and auto-reassigning approvals to reps. The module reads from the CRM and keeps rules explainable.

THE BUSINESS CASE

More selling time, faster approvals

COST TO TRY

Layers on the existing CRM; nothing is replaced.

VALUE

Rep hours go to revenue moves, and approvals get an owner and a deadline.

HOW IT IS MEASURED

Tasks done within the original target. Guardrail: tasks rescheduled 3+ times.

Built and testable today: Executable spec: phone view + manager view · 4 ranking rules, cap of 10 · Task lifecycle and approval-freeze rules · 15 UAT cases that run in the browser · Jira-ready user stories (CSV)

Validate first

Before any build, validate the approval-delay problem with 2–3 sales heads.
